How to sync google chrome bookmarks with your android phone. How to sync google drive on android. How to sync google chrome across devices. How to sync chrome on android. How to enable google sync on android.

Who will buy an Android phone? One of the key themes running through this week's Mobile World Congress has been the industry's first glimpse of the Google-backed Android platform. And it has provoked a fascinating cacophony of reactions from the mobile industry.We talked to Qualcomm's chief operating officer, Sanjay Jha. He told us the big challenge for Google and the Open Handset Alliance is to keep mobile operators happy. "I think it's a case of doing deals between the operators and Google to enable some level of comfort. [It's an] uneasy medium…completely open has some issues, completely shut certainly has its problems."Android has divided opinion at the show. Many are surprised at how far the OS has developed in terms of a usable interface. Others don't believe the hype. Understandably, this includes Microsoft (opens in new tab).Windows Mobile group product manager John Starkweather indicated his cynicism to us, saying "we know how long it takes" to get from a reference design such as that shown off by companies such as Qualcomm, Texas Instruments and ARM.Surprisingly responsiveCertainly, while Qualcomm's demo was the most feature-complete display of Android at the show, Texas Instruments' demo certainly showed us what it would be like in a phone form factor.Again, it's surprisingly responsive, even if on the demo none of the internet-based features are properly working. The home screen has icons for standard phone apps, Gmail, music player and so on, while there's also a Google start page which is a customised edition of Google's own home page with links to its other services.If this is what Android actually ends up like, it certainly won't be anything ground-breaking. For a quick look at the OS in action, check out this video.While Android has also been made out to be the ultimate in open operating systems, one handset manufacturer we spoke to questioned whether that strategy means much. "What does open actually mean?" he asked. It's a good point. With even Apple releasing its SDK for the iPhone, it's becoming easy to create mobile apps for all devices.Who will buy Android?It's also difficult to envisage who will actually buy a phone with Android on unless you're into phone customisation and hacking. Businesses are well catered for by Microsoft and RIM, while consumers looking for smart new devices may be swayed – but it depends on who opts to release Android handsets of course.We shouldn't judge yet though. Android isn't finished and has currently been released as an "early look" to developers. As is typical of something so closely related to Google, the Open Handset Alliance hasn't said that much about the Android framework.However, it has said that a key idea is to reduce the time it takes handset manufacturers to bring devices to market and reduce the cost of putting the OS on the phone.The Texas Instruments prototype handset is based on TI's OMAP850 processor and has Wi-Fi and Bluetooth built-in. If you have a phone running Android 2.2 (“Froyo”) or later, and use the Google Chrome Web browser (or Firefox) on your home computer, Chrome to Phone is a must-have. This useful utility allows you to send a Webpage from the Google Chrome browser directly to your phone and have it be opened by the appropriate application. For example sending directions from Google Maps opens them in the Maps app, whereas a standard Web page opens in the Android Web browser. This is a simple, elegant way to share information between your computer and mobile device. Click the Chrome to Phone location bar button while watching something on YouTube, and your phone opens up the video in the built-in YouTube player. The time between clicking the button and it being on your phone is usually about 2-3 seconds, which is incredibly fast. To clip text from a Web page, simply highlight the text, send it to you phone, and it will be copied into your device clipboard. To dial a phone number from a Web page, highlight and send it–your Android powered device will open up the “Phone” screen with the number already dialed. There is a minimum amount of setup required. First you need to download the Chrome to Phone extension for Chrome on your desktop. It will ask you to login to your Google account that you use with your phone. Do the same with the Chrome to Phone app on your phone, and you’re off and running. (Note: There is also an add-on available called FoxToPhone that gives Firefox the same ability to send links to Chrome to Phone.) Currently, the app does not support the use of Google Apps and only allows you to use one Google account at a time. Occasionally it seems to get hung up and the link doesn’t come through. However, these are minor bugs that barely detract from the amazing potential of this bit of software. In the future we’d like to see it expand its repertoire to include sending files, music, pictures, and apps. As-is, it’s a great first step toward integrating the mobile and desktop Web browsers. With the arrival of Chrome Beta for Android, the convergence of Google’s desktop and mobile browsers has begun. Chrome Beta for Android includes desktop features such as tabbed browsing, Incognito mode and bookmark syncing. It can also list any tab that’s currently open on the user’s desktop version of Chrome, and open it on the phone. Now for the bad news: Chrome for Android is only available on devices running Android 4.0, known as Ice Cream Sandwich. Right now, that includes Samsung’s Galaxy Nexus and Nexus S, Motorola’s Xoom and Asus’ Transformer Prime. Users can get the browser free from the Android Market. Here’s everything else you need to know about Chrome for Android: How Does Tabbed Browsing Work? On Android phones, individual tabs don’t appear on screen together, like they do in some third party browsers such as Dolphin. Instead, you quickly move between tabs by swiping from the phone’s left or right bezel, or show all tabs by tapping a button next to the search and URL bar. On tablets, tabs are arranged side-by-side, in similar fashion to the existing stock Android browser. How Does Desktop Sync Work? Chrome for Android places desktop bookmarks in their own folder on the mobile browser’s new tab page, so they don’t get mixed up with other bookmarks. Another section of the new tab page shows any open tab for any computer that’s signed in to the user’s Google account. The mobile browser also syncs auto-complete suggestions from the desktop, drawing on your search and browsing history. What Other Features Are There? As TechCrunch reports, Chrome for Android uses hardware acceleration to make browsing feel smoother and snappier, and it can pre-load pages based on what links it thinks you’ll click, just like desktop Chrome (but only over Wi-Fi, to prevent excess mobile data use). It also includes some advanced HTML5 features such as Web Workers, which allow Web apps to update in real-time. Unfortunately, the browser doesn’t yet have a way to always request the desktop version of Websites instead of mobile-optimized sites. The browser also has one other feature not found in the desktop version of Chrome: When tapping on an area filled with links, a magnified view appears to ensure you’re clicking on the right thing. What About Plug-Ins and Extensions? The current version of Chrome for Android doesn’t support plug-ins, but All Things Digital reports that the browser’s architecture supports them. There are no plans to support Flash on the mobile browser, however. As for extensions, MG Siegler reports that Google is figuring out how to make them work best on mobile devices. Why Only Android 4.0? According to MG Siegler, Chrome for Android uses APIs not found in earlier versions of Android, so there’s not much hope for Gingerbread or Froyo users. As TechCrunch points out, Firefox for Android offers similar syncing features between the desktop and mobile devices, if that’s any consolation. What Will Become of the Stock Android Browser? Eventually, it’ll go away, but Google hasn’t announced timing. Still, with Android’s ability to set alternate browsers as the default, Android Ice Cream Sandwich users can make a complete switch to Chrome today. Follow Jared on Twitter, Facebook or Google+ for even more tech news and commentary. By Harvey Birdman i Comstock/Comstock/Getty Images Syncing your computer with your Android phone is a great way to get your music from your computer to your new smart phone. The syncing will also allow for the Android smart phone to be constantly updated with any new music every time you hook the Android smart phone to the computer. All you need is a USB cable, a few clicks of the mouse and how much time it takes for the music files to be transferred to your Android smart phone. Turn on your computer and Android phone. There will be a power button on the front or side of the Android phone depending upon the model and carrier. The computer will have a power button on the front as well. Wait for both to go through their startup procedures before advancing to the next step. Plug a USB cable into the USB port on your computer. Then plug the other end of the USB cable into the Android smart phone. Some models of Android smart phones will have the USB port behind a rubber seal. If so, peel the seal back with your finger nail and slot the USB plug into the port underneath. Click "USB Storage Device" when you computer prompts you with a pop up menu. Even though you will be syncing the phone via Windows Media Player later, you must first authorize the phone to act like a store device. The Android smart phone will then appear as a drive icon on your desktop. Double-click on your Windows Media Player icon in your Start menu. Click on the "Sync" tab on the top, this will display a list of phones currently attached to the computer. There should be none at this point. Click the white box and then select "Set Up Sync" in the drop-down menu. Type in the name of the Android smart phone (you named the phone when you first set it up). Click "Finish" and then wait for the Windows Media Player to inventory the music database on the phone. Synchronize the music between the computer and the Android smart phone. Do not disconnect the phone while it is transferring or it could corrupt the music file. If you do have to disconnect the phone, reconnect it and re-sync the Android smart phone as soon as possible to repair the damaged files. There will be no long term hardware damage.
